The Arabidopsis thaliana apurinic endonuclease Arp reduces human transcription factors Fos and Jun.";

Transcription factors Fos and Jun.";

Proc. Natl. Acad. Sci. U.S.A. 91:3299-3303(1994).

Tedox factor: Is multifunctional and may be involved both in DNA repair and in the regulation of transcription.

Tedox factor: Is multifunctional and may be involved both in DNA repair and in the regulation of transcription.

Tedox factor: Is multifunctional and may be involved both in DNA repair and in the regulation of transcription.

Tedox factor: Is multifunctional and may be involved both in DNA repair and in the regulation of transcription.

Tedox factor: Is multifunctional unsaturated sugar and a product with a printing a 3'-terminal unsaturated sugar and a product with a creminal 5'-phosphate.

Terminal 5'-phosphate.

Terminal 5'-phosphate.

Terminal 5'-phosphate or seen in the leaves.

Thissue specificity: Expressed in the siliques, flowers, and stems.

A high level expression is seen in the leaves.

This IMPARITY: Contains 1 SAP domain.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

### ALIGNMENTS

RESULT 1

The invention relates to a method of determining IgE levels in a body fluid sample, by contacting the sample with a reshaped human monoclonal antibody (RA) having a binding affinity about equal to that of the murine CDR-donor antibody TES-C21 produced by the cell line 11133. The antibodies are useful in the diagnosis, prophylaxis and treatment of allergy. This sequence represents the complementarity determining region (CDR) 1 from the light chain variable domain of a reshaped human antibody Diagnosis; IgE; immunoglobulin; body fluid; human; monoclonal antibody; binding affinity; mouse; CDR; complementarity determining region; CDR1 domain reshaped human antibody light chain variable region. new method for determining IgE levels in a sample. The invention relates to a method for inhibiting the growth of tumours in human patients by treating with an effective amount of a combination of radiation and a non-radiolabelled protein receptor tyrosine kinase (PRTK) inhibitor, the overexpression of which can lead to tumourigenesis. The method can be used in the treatment of tumours of e.g. breast, lung, color, kidney, bladder, head and neck, overy, prostate or brain. The administration of a suitable antibody to the patient makes the tumour more susceptible to radiotherapy
                                                                                                                                                                                                                                                                                   Hypervariable region, complementarity determining region, CDR, tumour; single chain antibody, growth inhibitor; human, tumourigenesis; therapy, protein receptor tyrosine kinase, light chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Treatment of human tumors, using a combination of radiation and a non-radiolabeled protein receptor tyrosine kinase inhibitor.

This invention relates to a method for inhibiting the growth of refractory tumours that are stimulated by a ligand of epidernal growth factorized receptor (EGFR) in human patients. The method involves treating the patient with a combination of EGFR/Human EGF-1 (HER1) antegonist, optionally with a chemotherapeutic agent or radiation. The antagonist can be for example a chimeric anti-EGFR monoclonal antibody, C225. The COT CARPHIER1 antagonist is useful for inhibiting the growth of refractory tumours such as tumours of breast, heart, lung, small intestine, colon, Eplem, kidney, bladder, head and there, ovary, prostate, brain, pancreas, skin, bone, bone marrow, blood, thymus, uterus, testicles, cervix and liver, preferably squamous cell carcinomas. The present sequence region complementarity determining region 1 amino acid sequence of the chimeric anti-EGFR monoclonal antibody C225 which is used in an example illustrating the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ..

```
New single chain polypeptide that binds to epidermal growth factor receptor - is derived from antibody 14E, used for treatment and diagnosis of cancer or other cell proliferative diseases.
                                                                                                                                                                                                                                                                                                                                      The present sequence represents the light chain variable domain of murine monoclonal antibody 1451. This antibody is active against the human epidermal growth factor receptor (EGF-R). The sequence is used to construct a single-chain polypeptide (scFv) that has binding affinity for an EGF-R. The scFv comprises two segments which contain the binding parts of the heavy and light chain variable domains of the monoclonal antibody 1481. The scFvs of the invention are used to cardinomas (gliomas, melanomas and tumours) that overexpress EGF-R, specifically EGF-RVIII, relative to normal cells, particularly by blocking proliferation of such vitro purging. When the scFv is appropriately labelled, it can be used diagnostically to image cells that express EGF-R, specifically breast
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antibody; heavy chain; light chain; variable region; therapy; constant region; prophylaxis; prevention; allergy; identification; allergic reaction; immunoglobulin; IgE; determination.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention relates to a novel method for treating a mammal with the hyperproliferative disease stimulated by a ligand of a member of the epidermal growth factor (BGF) family of receptors. The method involves commissering an antibody or a defective receptor that is an antagonist of a member of the EGF receptor family, or a combination of the antagonist and phototherapy, chemotherapeutic agent or radiation therapy. The antibody used in the method of the invention acts as an epidermal growth factor receptor (BGFR) antagonist by inhibiting EGFR /HERL phosphorylation. The method of the invention is useful for treating a mammal with hyperproliferative disease such as psoriasis, actinic keratoses, seborrheic keratoses, wartes, keloid scars and eczema stimulated by a ligand of a member of the EGF family of receptor. This sequence represents the murine anti-EGF 255 antibody light chain (LH) the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                     Treating a manmal with hyperproliferative disease especially psoriasis, stimulated by ligand of member of epidermal growth factor family of receptors, by administering antagonist of the receptor.

                                                                                                                                                                   Reshaped human monoclonal antibodies can be used in the prophylaxis and/or treatment of allergic reactions in humans. The monoclonal antibodies can also be used for the qualitative or quantitative determination of IgE and for the determination of surface IgE positive B cells. They can provide a long lasting therapeutic effect without inducing immunogenicity as foreign proteins. The CDR's from the variable heavy and light chains of the murine antibody TES-C21 were used in the construction of a molecular model of the variable heavy and light chains for the murine antibody and light chains and light chain framework regions. (Updated numan variable heavy field.) (Updated on 25-MAR-2003 to correct PM field.)
                                                                                                                                                                                                                                                                                                                                   Gaps

Kappa, light chain, reshaped, monoclonal, antibody, 225RA, human, edjdermal growth factor; EGF, receptor; inhibition; growth, tumour; cell, late stage, prostatic; prostate, variable region; framework; complementarity determining region; CDR.
                                                                                                                                                                                                                                                                                                                                        Chimeric and humanised versions of anti-EGF receptor antibody 225 - used for inhibiting tumour growth, esp. of late stage prostatic tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is the kappa light chain variable region of the reshaped human monoclonal antibody (MAD) H225, 225RA. The MAD is specific for the human epidermal growth factor (EGF) receptor. The MAD, or a fragment, can be used to inhibit the growth of tumour cells, especially late stage prostatic tumour cells in humans, optionally conjugated to a cytotoxic agent, especially doxorubicin, taxol or cisplatin, or a signal transduction, ras or cell cycle inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The invention relates to a method of determining IgE levels in a body fluid sample, by contacting the sample with a reshaped human monoclonal antibody (RA) having a binding affinity about equal to that of the murine CDR-donor antibody TES-C21 produced by the cell line 1113. The antibodies are useful in the diagnosis, prophylaxis and treatment of allergy. This sequence represents the light chain variable domain from the TES-C21 antibody. The fragments encoding the complementarity determining regions are used to generate the reshaped antibodies of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present protein sequence is the Vkappa (kappa chain variable region) of the humanised antibody Hu-901. This is an exemplary anti-IgE (anti-immunoglobulin E) monoclonal antibody produced by hybridoma TES-C21. The heavy and light chains are obtained through RT-PCR using the RNA from the transfectoma cell line producing the chimeric antibody. Humanised anti-IgE genes are incorporated in the genome of a recombinant adenovirus vector as an independent transcriptional unit, and packaged into infectious virus particles. Upon infection of host, the recombinant adenovirus vector will direct the production of either intact anti-IgE antibody or an scFv fragment in the serum, which will bind free
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Humanised antibody-901, Hu-901; Vkappa; kappa chain variable region; anti-19g; anti-1pg; anti-1-munoglobulin E; monoclonal antibody; hybridoma TES-C21; recombinant adenovirus vector; anti-19E antibody; gene therapy; scFv; single chain variable fragment; allergy; antiallergic.

                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is the kappa light chain variable region of the reshaped human monoclonal antibody (Wab) H325. 225R%, The Mab is specific for the human epidermal growth factor (EGF) receptor. The Mab, or a fragment, can be used to inhibit the growth of tumour cells, especially late stage prostatic tumour cells in humans, optionally conjugated to a cytotoxic agent, especially doxorubicin, taxol or isplatin, or a signal transduction, ras or cell cycle inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The monoclonal antibodies can also be used for the qualitative or quantitative determination of IgE and for the determination of surface IgE positive B cells. They can provide a long lasting therapeutic effect without indicing immunogenicity as foreagn proteins. This sequence is a slightly modified version of C21-L1 described in ARE50187, having glutamic acid at position 1 of the mature protein instead of aspartic acid and value at
circulating 1gE, resulting in the reduction of free serum 1gE. The binding of the antibody or fragment to 1gE-bearing B cells may lower 1gE levels by down-regulating 1gE production by these B cells. These methods are useful in the gene therapy of allergic diseases
                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New reshaped human monoclonal antibody specific for IgE - used for prophylaxis or treatment of allergic reactions or qualitative or quantitative determn. of IgE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antibody; heavy chain; light chain; variable region; therapy; constant region; prophylaxis; prevention; allergy; identification; allergic reaction; immunoglobulin; IgE; determination.

The monoclonal antibodies can also be used for the qualitative or quantitative determination of IgE and for the determination of surface IgE positive B cells. They can provide a long lasting therapeutic effect without inducing immunogenicity as foreign proteins. (Updated on 25-MAR-2003 to correct PM field.) (Updated on 25-MAR-2003 to correct PM field.)
position 3 of the mature protein instead of leucine (positions 21 and respectively of this sequence). (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Reshaped human monoclonal antibodies can be used in the prophylaxis and/or treatment of allergic reactions in humans. The monoclonal antibodies can also be used for the qualitative or quantitative determination of IgE and for the determination of surface IgE positive B cells. They can provide a long lasting therapeutic effect without inducing immunogenicity as foreign proteins. This sequence is a slightly modified version of C21-L1 described in AAR50187, having aspartic acid at position 60 of the mature protein (position 80 of this sequence) instead of serine. (Updated on 25-MAR-2003 to correct PM field.) (Updated on 25-MAR-2003 to correct PM field.)

C225; is specific for the human epidermal growth factor (EGF) receptor. C225, or a fragment, can be used to inhibit the growth of tumour cells, especially late stage spotstatic tumour cells in humans, optionally conjugated to a cytotoxic agent, especially doxorubicin, taxol or cisplatin, or a signal transduction, ras or cell cycle inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Chimeric and humanised versions of anti-EGF receptor antibody 225 - used for inhibiting tumour growth, esp. of late stage prostatic tumour.

                                                                                                                                                                                                                                                                                                                                                                                                                                                           Chimeric and humanised versions of anti-EGF receptor antibody 225 - used for inhibiting tumour growth, esp. of late stage prostatic tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is the kappa light chain variable region of the murine monoclonal antibody (MAb) M225, which is specific for the human epidermal growth factor (EGF) receptor. The MAb, or a fragment, can be used to inhibit the growth of tumour cells, especially late stage prostatic tumour cells in humans, optionally conjugated to a cytotoxic agent, especially doxorubicin, taxol or displatin, or a signal transduction, ras or cell cycle inhibitor. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                      Kappa light chain variable region of M225 antibody.

Sequence 54, Application US/08127721A

GENERAL INFORMATION:
APPLICANT: Hardman, No. 6066718man
APPLICANT: Saldanha, Jose
TITLE OF INVENTION: Reshaped monoclonal antibodies against an
TITLE OF INVENTION: immunoglobulin isotype
NUMBER OF SEQUENCES: 55

CORRESPONDENCE ADDRESS:
ADDRESSER: No. 6066718artis Patent and Trademark Department
STREET: 59 ROUTE 10

CITY: East Hanover
                                                                                        GENERAL INFORMATION:
APPLICANT: Hardman, No. 5958708man
APPLICANT: Kolbinger, Frank

Treatment of human tumors, using a combination of radiation and a non-radiolabeled protein receptor tyrosine kinase inhibitor. WPI; 2000-062440/05. N-PSDB; AAZ48629.

Disclosure; Page 15; 31pp; English.

This sequence is the hypervariable region CDR2 (complementarity determining region 2) of the light chain of a single chain antibody deterived from the murine antibody 225. The invention relates to a method for inhibiting the growth of tumours in human patients by treating with an effective amount of a combination of radiation and a non-radiolabelled protein receptor tyrosine kinase (RRTK) inhibitor, the overexpression of which can lead to tumourigenesis. The method can be used in the treatment of tumours of e.g. breast, lung, colon, kichey, bladder, head and neck, ovary, prostate or brain. The administration of a suitable antibody to

the patient makes the tumour more susceptible to radiotherapy

The method involves treating the patient with a combination of EGFR/human EGF-1 (HERI) antagonist, optionally with a chemotherapeutic agent or radiation. The antagonist can be for example a chimeric anti-EGFR monoclonal antibody, C25. The EGFR/HERI antagonist is useful for inhibiting the growth of refractory tunnours such as tunnours of breast, heart, lung, small intestine, colon, spleen, kidney, bladder, head and neck, ovary, prostate, brain, pancreas, skin, bone, bone marrow, blood, thymus, uterus, testicles, cervix and liver, preferably squamous cell carcinomas. The present sequence liver, preferably squamous cell carcinomas. The present sequence region 2 amino acid sequence of the chimeric anti-EGFR monoclonal antibody C225 which is used in an example illustrating the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Epidermal growth factor receptor/human epidermal growth factor receptor-1 antagonist for inhibiting the growth of refractory tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Refractory tumour growth inhibition; epidermal growth factor receptor; EGFR antagonist; cancer; squamous cell carcinoma; anti-EGFR antibody; complementarity determining region; CDR.

                                                           This invention relates to a novel method for treating a mammal with hyperproliferative disease stimulated by a ligand of a member of the epidermal growth factor (EGP) family of receptors. The method involves administering an antibody or a defective receptor that is an antagonist of a member of the EGF receptor family, or a combination of the rantagonist and phototherapy, chemotherapeutic agent or radiation therapy. The antibody used in the method of the invention acts as an epidermal prosphorylation. The method of the invention is useful for treating a mammal with hyperpoliferative disease such as positissis, actinic keratoses, seborrheic keratoses, warts, keloid scars and eczema stimulated by a ligand of a member of the EGF family of receptor. This sequence represents the murine anti-EGF 25s antibody light chain (LH) hypervariable region (CDR2) used as an inhibitor of EGFR in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ٠.

The invention relates to a method of determining IgE levels in a body full d sample, by contexting the sample with a reshaped human monoclonal antibody (RA) having a binding affinity about equal to that of the murine CDR-donor antibody TES-C21 produced by the cell line 11133. The antibodies are useful in the diagnosis, prophylaxis and treatment of allergy. This sequence represents the complementarity determining region (CDR) 2 from the light chain variable domain of a reshaped human antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human, NKG2D, NKG2D receptor complex; cancer; infectious disease; tumour; autoimmune disease; head; neck; stomach; oesophagus; colon; liver; ovary; intrahepatic bile duct; pancreas; lung; larynx; breast; uterus; cervix; prostate; kidney; testis; thyroid; bladder; brain; melanoma; mysloma; karcoma; leukaemia; lymphoma; virus; bacterium; fungus; protozoan; DAP10; helminth; cytostatic; antimicrobial; immunomodulatory; 1182D10; 6H7B7; 8G7C10; 6ESA7; 1182D10; 47; 635A724-7; 8G7C10; 655A74-7; 8G7C10; 655A74-7; P4-2; P4-3; P4-14; P4-15; P5-2; P5-3; P5-9; P5-10; P5-11; P5-23; 3B10xP4-3; 3B10xP4-14; p53 tetramerisation domain; 3B10xP5-2; 3B10xP5-23.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequences given in AAR37599-604 represent the complementarity-determining regions (CDRs) of a humanised antibody (Ab) which binds specifically to human interleukin (IL)-2 receptor (HIL2R). These CDRs were derived from the murine anti-human IL-2 receptor monoclonal Ab (MAD) (CC B-B10 (see also AAQ43242-43). This MAD is antagonistic to the binding of IL-2 to the IL-2 receptor on human T-cells. It also inhibits the human compact the Transport of the binding of the B-B10 (Ab was cloned by PCR and sequenced (see also AAQ43256-32 and AAQ43233-36). A human Ab with high levels of amino acid sequence homology to the human about the Hammon's could writh the B-B10 V region CDR and the framework of this Ab was bound with the B-B10 V region CDR and a part of the framework to design several kinds of the humanised B-B10 V region (see also AAQ43244-45). The CDRA sequence coding this humanised B-B10 was synthesised and a plasmid expressing humanised B-B10 was constructed. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Humanised antibody comprising - CDR region of mouse MAB B-B10 specific for IL-2 receptor useful for treating carcinoma expressing IL-2 receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Diagnosis, IgE; immunoglobulin; body fluid; human; monoclonal antibody;

The invention relates to a multifunctional polypeptide comprising a domain with a binding site that specifically recogniess an extracellular group of the NKG2D receptor complex and a second domain which functions as a receptor or ligand. The polypeptide and its associated concious account of the NG2D receptor of an extracellular polymolectide are used for the preparation of a pharmaceutical composition. The cancer may be a tumour of the had and neck, stomach, conditions. The cancer may be a tumour of the had and neck, stomach, cosophagus, colon, liver, intrahepatic bile ducts, pancress, lung, larger are to brain, or a melanoma, myeloma, sarcoma, leukaemia or lymphoma. The infectious diseases can be caused by viruses, bacteria, fungi, bladder or brain, or a melanoma, myeloma diseases include multiple clerosis, Grave's disease, ankylosing spondylitis, acute anterior uveitis, Goodpasture's syndrome, myasthenia gravis, insulin-dependent disease multimmune hepatitis. Sequences AUT2820-AAUT2875 represent the NKG2D receptor and the polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human, NKG2D; NKG2D receptor complex; cancer; infectious disease; tumour; autoimmune disease; head; neck; stomach; oesophagus; colon; liver; ovary; intrahegatic bile duct; pancreas; lung; larynx; breast; uterus; cervix; prostate; kidney; testis; thyroid; badder; brain; melanoma; myeloma; Fv sarcoma; lenkaemia; lymphoma; virus; bacterium; fungus; protozoan; DAP10; helminth; cytostatic; antimicrobial; immunomodulatory; llB2D10; 6H7B7; 8G7C10; 6E5A7; llB2D10; 6H7B7; P4-15; P5-2; P5-3; P5-9; P5-10; P5-11; P5-23; B10xP4-3; B4-14; P5-15; b5-23; B5-24; B10xP4-14;

The invention relates to a multifunctional polypeptide comprising a domain with a binding site that specifically recogniess an extracellular group of the NG2D receptor complex and a second domain which functions are a receptor or ligand. The polypeptide and its associated composition for the treatment of cancer, infections and/or autoimmune conditions. The cancer may be a tumour of the head and neck, stomach, cosophagus, colon, liver, intrahepatic bile ducts, pancreas, lung, larym, breast, ovary, uterus, cervix, prostate, kidney, testis, thyroid, bladder or brain, or a melanoma, myeloma, leukaemia or lymphoma. The infectious diseases can be caused by viruses, bacteria, fungi, proteoza or helminths. The autoimmune diseases include multiple sclerosis, drave's disease, ankylosing spondylitis, acute anterior uveitis, Goodpasture's syndrome, myasthenia gravis, insulin-dependent autoimmune hepatitis. Sequences ANU72820-AANU72875 represent the NKG2D receptor and the polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               29. .33

The present sequence comprises a summary of the complementarity determining regions (CDRs) of the light chain and heavy chain of the Antibody regions (CDRs) of the light chain and heavy chain of the Antibody regions separating the CDRs in the scFv are not given in the sequence. Rabbit scFv antibodies (see ABB79657-81) for B-CLL-specific cell surface antigens were selected using antibody page display and cell surface panning. The invention provides a CLL line, CLL-AAT, derived from a B-CLL primary line without immortalisation by Epstein-Barr virus. The cell line is used to generate antibodies useful in the diagnosis and/or treatment of CLL. Antibodies derived from recombinant libraries may be selected using CLL-AAT as bait to isolate antibodies on the basis of specificity. Single chain antibodies are of particular use as they remain stable in the cytoplasm and retain intracellular binding activity. The binding of the present scFv antibody to primary human cells and cell ince was determined by whole cell ELISA as follows: CLL (primary humans and CLL-AAT cell line) ++; normal, primary human B lymphocytes, +; non-Hodgkin's lymphoma cell line RL -; Burkitt's lymphoma cell line Ramos, - Hodgkin's lymphoma cell line RL -; Burkitt's lymphoma cell line Ramos, the VL and VH regions of the scFv. The antigen recognised by this scFv was CD23, determined by immunoprecipitation and mass spectrometry 100.0%; Score 25; DB 5; Length 61; 100.0%; Pred. No. 53;

The present sequence comprises a summary of the complementarity determining regions (CDRs) of the light chain and heavy chain of the chronic lymphocytic leukaemia (CLL) specific rabbit serv antibody F2d.

Antibody regions separating the CDRs in the scrv are not given in the sequence. Rabbit scrv antibodies (see ABB79657-81) for B-CLL-specific cell surface antigens were selected using antibody phage display and cell surface panning. The invention provides a CLL line, CLL-AAT, derived from a B-CLL primary line without immortalisation by Epstein-Barr virus. The creatment of CLL. Antibodies derived from recombinant libraries may be selected using CLL-AAT as bait to isolate antibodies on the basis of specificity. Single chain antibodies are of particular use as they remain specificity. Single chain antibodies are of particular use as they remain specificity. Single chain antibodies are of particular use as they remain school in the present scrv and clubarian and cell lines was determined by whole cell ELISA as follows: CLL (primary tumours and chain such cell lines was determined by whole cell ELISA as follows: CLL (primary tumours and human erythroleukaemia cell line RL, -; Burkitt's lymphoma cell line Ramos, and human erythroleukaemia cell line FP-1, -. A short linker separates

The present sequence represents the light chain variable domain of murine monoclonal antibody 14E1. This antibody is active against the human epidermal growth factor receptor (EGF-R). The sequence is used to construct a single-chain polygeptide (scFv) that has binding affinity for an EGF-R. The scFv comprises two segments which contain the binding parts of the heavy and light chain variable domains of the monoclonal antibody 14E1. The scFvs of the invention are used to treat carcinomas (gliomas, melanomas and tumours) that overexpress EGF-R, specifically EGF-RVIII, relative to normal cells, particularly by blocking proliferation of such vitro purging. When the scFv is approxiately labelled, it can be used diagnostically to image cells that express EGF-R, specifically breast
                                                                                                                                                                                                                                                                                                             New single chain polypeptide that binds to epidermal growth factor receptor - is derived from antibody 14E, used for treatment and diagnosis of cancer or other cell proliferative diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              immunosuppression; tissue transplantation; graft; L chain; V region;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This polypeptide comprises the light chain variable region of murine monoclonal antibody (MAb) 48-127. This MAb recognises an epitope of gp54 antigen (frop-2), a cancer marker expressed at the surface of bladder, breast, uterine and prostate cancers. MAb 48-127 (IgG1) reacts with a majority of human bladder cell lines and with human breast carcinoma cell lines. The invention relates to novel single chain antibody (scFv) molecules, including a 48-127 scFv (see AAW2679) that comprises the 48-127 VH and VL chains joined via a linker. Such scFvs can be used to detect cancers and micrometastases, e.g. bladder, prostate, breast or uterine cervix cancers, and may be linked to specific toxins for use in cancer therapy. The scFvs are not immunogenic and are distributed and captured by 9P45-bearing target cells more quickly than conventional
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New recombinant antibodies to gp54 antigen - used for the detection of cancers and metastases and for therapy of cancers expressing the gp54
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           treatment; carcinoma;

                                                                                                                                                                                                                       This sequence is the light chain variable region of a preferred anti-IL2R beta monoclonal antibody for use in the claimed synergistic composition. The anti-IL2R beta antibody is used with at least one anti-CD4 antibody. Individually the antibody served with inhibiting and when used together their immunosuppressive properties are improved; they synergistically inhibit T-helper cell proliferation to effectively inhibit transplant rejection at low doses without significantly reducing the general immune response. See AAQ36607-Q36616. (Updated on 10-MAR-2003 to add missing OS field.) (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                 Synergistic antibody compsn. for use as immunosuppressant - comprises monoclonal anti-CD4 antibodies and monoclonal anti-IL2R alpha- or anti-IL2R beta antibodies.

The sequences given in AAR37609-10 represent the heavy (H) and light (L) chain variable (V) regions of the murine anti-human IL-2 receptor monoclonal antibody (MAD) B-10, respectively. This MAD was used in the construction of a humanised antibody (AD) which binds specifically to human interleukin (IL)-2 receptor (HIL2R). The complementarity-catemining regions (CDRs) for the hIL2R MAD were derived from B-110 (see also AAR37599-04). The hIL2R MAD is antagonistic to the binding of IL-2 to the IL-2 receptor on human T-cells. It also inhibits the human mixed lymphocyte reaction. The CDNA encoding the variable (V) region of ILe B-10 W pass cloned by PCR and sequence (see also AAQ43226-32 and AAQ43233-36) A human AD with high levels of amino acid sequence homology to the murine sequence was selected and the framework of this AD was bound with this sequence was selected and the framework of this AD was bound with thinds of the humanised B-10 V region. The DNA sequence coding this humanised B-10 W as synthesised and a plasmid expressing humanised B-10 was synthesised and a plasmid expressing humanised B-10 was constructed. (Updated on 25-MAR-2003 to correct PN field.)

J. Biol. Chem. 277:21955-221961(2002).

J. Biol. Chem. 277:21955-221961(2002).

J. SUBCINIT: Component of the conserved oligomeric Golgi complex which conjugated in ER-Golgi transport.

J. SUBCINIT: Component of the conserved oligomeric Golgi complex which conjugated morphology and localization (By similarity).

J. SUBCELLULAR LOCATION: Golgi. Associated with the peripheral membrane of cisfmedial cisternae.

T. SUBCELLULAR LOCATION: Golgi Associated with highest levels in pancreas and testis and lowest levels in lung.

J. SIMILARITY: Belongs to the COG3 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This SWISS-PROT entry is copyright. C. - COFACTOR: Binds 1 zinc ion per subunit (By similarity).

C. - SUBULIT: Homodaimer (By similarity).

C. - SUBULIT: Belongs to class-II aminoacyl-tRNA synthetase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

Multidrug reasistance mediated by a bacterial homolog of the human
multidrug reasistance mediated by 33:1068-10672(1996).

- Proc. Natl. Acad. Sci. U.S.A. 93:1068-10672(1996).
-!- FUNCTION: Efflux transporter for a variety of amphiphilic cationic
compounds, including antibiotics.
-!- SUNGNICH Homodimer (Potential).
-!- SUNGNICH Homodimer (Potential).
-!- SUNGNICH LOATION: Integral membrane protein (Probable).
-!- SUNICHELITE: Belongs to the ABC transporter family.
                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
